                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                            New peptides are disclosed which are designated "protegrins". The peptides are useful as antibacterial, antiviral and antifungal agents in both animals and plants. The peptides are 16-18 amino acids in length and are characterised by four invariant Cys residues at positions 6, 8, 13 and 15 and either (1) by a characteristic pattern of basic and hydrophobic amino acids and/or (2) being isolatable from animal (e.g. porcine) leukocytes; or analogues of these peptides in which 1-4 of the peptides can be produced synthetically and some can be produced recombinantly or can be isolated and purified from their native sources. The peptides can be modified by N-acylation and/or C-terminal amidation or esterification, and can be in linear or cystine-bridged form. D-Amino acid residues can be present.

AAB30440-85 represent peptides derived from galectin family members. Galectin-3 has been associated with assorted processes such as cell growth, tumour transformation, and metastasis. It is composed of two domains: a carbohydrate-binding region on the carboxy terminal which binds saccarides with terminal galactose residues, and an amino terminal domain consisting of tandem repeats of nine amino acids. The expression of galectin-3 is induced in cirrhotic liver and hepatocellular carcinoma, and so is useful as a marker of cirrhotic liver and hepatocellular carcinoma. Galectin-3 is used in diagnostic, prognostic and therapeutics for the treatment and prevention of hepatocellular carcinoma. It is useful for determining whether an individual is suffering from hepatocellular carcinoma or is likely to suffer from hepatocellular carcinoma or any neoplasm of liver origin or cirrhosis of the liver in the future.
Cirrhotic liver and hepatocellular carcinoma marker galectin-3, useful in diagnostic, prognostic and therapeutic methods for treating and preventing hepatocellular carcinoma -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Phosphorylase kinase gamma subunit; replacement therapy; glycogen utilisation disorder; muscle glycogenosis; hypoglycaemia;

                                                                                                                                                                                                                                                                                                                                            The present sequence represents a novel human phosphorylase kinase gamma subunit, characterised as having homology to other phosphorylase kinase subunit, characterised as having homology to other phosphorylase kinase as subunits. Recombinant human phosphorylase gamma subunit is useful for replacement therapy in cases of glycogen utilisation disorders, e.g. muscle glycogenosis, causing muscular weakness and atrophy, or transformed with the DNA encoding the present sequence can also be used to screen for modulators of human phosphorylase kinase gamma subunit cativity, i.e. potential therapeutic agents. The protein can also be used continuity, i.e. potential therapeutic agents. The protein can also be used to suppress mutant forms of the this gene. The protein can be used to raise specific antibodies, useful as immunoassay reagents.

C Fragments of the DNA encoding the present sequence can be used cativation, e.g. to detect or quantify gene expression, to isolate thosphorylase kinase gamma subunit-expressing genes and for mapping the

HPHKG. The polypeptides and nucleic acids encoding them can be used for treating pathophysiological conditions caused by aberrant forms of phosphorylase kinase (PHK) and by deficiencies in PHK activity. They can utilisation and consequent glucose depletion, e.g. muscle glycogen utilisation and consequent glucose depletion, e.g. muscle glycogenosis, involving muscular weakness and atrophy, and hypoglycemia, which may lead dysfunction or failure. The products can also be used for antibody production, detection, diagnosis and drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Phosphorylase kinase; gamma subunit; glycogen; calcium dependent; catabolism; glucose; mobilisation; glycogen phosphorylase; GP; regulation; phosphorylation; activation; genetic heterogeneity; muscle; liver; hepatic; glycogenosis; deficiency; disease; exercise intolerance; weakness; muscular atrophy; hypoglycaemia; hepatomegaly; antibody;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                This sequence legicalises a movel yamme account. Or prospers, place.

This sequence legicalises a movel yamme account. Or prospers of the regulates glycogen phosphorylases (GP), which is responsible for the catabolic breakdown of glycogen to glucose.

Phy Rhosphorylates GP, thereby activating it, leading to mobilisation of glucose reserves for ATP production. Phy consists of 4 different subunits: regulatory alpha and beta subunits, calmodulin (delta subunit) and the catalytic gamma subunit. Since the enzyme is composed of 4 non-identical subunits, Phy deficiency has significant potential for genetic heterogeneity. Muscle glycogenosis caused by Phx deficiency leads to exercise intolerance, weakness and muscular atrophy. Hepatic phy deficiency is also associated with certain hepatic diseases characterised by hypoglycaemia and hepatomegaly. This Phx gamma subunit or enzymatically active fragments thereof may be used to raise pathophysiological conditions caused by aberrant forms of Phx, and deficiencies in Phx activity. Prior art treatment for Phx deficiency related disease involves dietary regimes which do not prevent the

```
apoptosis inducing kinase) having apoptosis inducing activity. The kinases can be expressed recombinantly by transforming host cells with vectors comprising the nucleic acids encoding the kinases. The kinases are useful in the treatment, prevention, diagnosis and investigation of diseases with which apoptosis is associated, such as hormonally regulated cancer (such as breast cancer, ovarian cancer, lymphoma); autolimune diseases; viral infections (such as heroes, adenovirus, poxvirus, HIV); Alzheimer's disease; Parkinson's disease; arteriosciarosis; alocholism; rheumatoid arthritis; and diabetes. The present sequence represents the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; mouse; protein kinase; antiarthritic; antisclerotic; osteopathic; immunosuppressive; cardiant; renal; antiinflammatory; antiasthmatic; dermatclogical; antidabetic; antiinfertility; qene therapy; vaccine; immune disorder; cardiovascular disease; neurodegenerative disease; cancer; autoimmune disorder; stroke; inflammatory bowel disease; inflammatory pelvic disease; multiple sclerosis; psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids encoding kinase polypeptides, useful for diagnosing and treating immune-related diseases and disorders, cardiovascular disease,

The present sequence is an antimicrobial protegrin peptide, which has a broad spectrum of activity against microbial targets, including gram-positive and gram-negative bacteria, yeast, fung, concluding gram-positive and gram-negative bacteria, yeast, fung, protozoa and certain strains of viruses and retroviruses, e.g. HIV.

It can be used to preserve or disinfect a variety of materials, concluding medical equipment, foodstuffs, cosmetics, contact lens solutions, medicaments or other nutrient containing materials. It can also be used for the prophylaxis or treatment of microbial infections or diseases in plants and animals, e.g. conjunctivitis, keratitis, corneal ulcres, stomach ulcress associated with Helicobacter pylori, sexually transmitted diseases, gram-negative sepsis, endocarditis, pneumonia and other respiratory infections, urinary tract infections, systemic candidiasis and oral mucositis. It is biostatic or biocidal against clinically relevant pathogens exhibiting multi-drug resistance, e.g. vancomycin resistant Enterococcus pneumoniae and methicillin resistant Staphylococcus aureus (MRSA). It is given at a dosage of 0.1 to 5, preferably 0.5 to 1 mg/Kg/day, by injection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0; Gaps

                                                                                                                 -i- FUNCTION: CATESTATIN INHIBITS CATECHOLAMINE RELEASE FROM
CHROMAFFIN CELLS AND NORADRENERGIC NEURONS BY ACTING AS A NON-
COMPETITIVE NICOTINIC CHOLINEGIC ANTAGONIST.

-i- FUNCTION: VASOSTATIN-I HAS AWTIBACTERIAL ACTIVITY AGAINST GRAM-
POSITIVE BACTERIA M.LUTEUS, B.UBSTHEIS, S.PROGENES, M.FORTUTUM,
S.AUREUS AND L.MONOCYTOGENES AND AGAINST GRAM-
BCOLI, E.CLOACAE, S.TYPHIMMRIUM, K.PNEUMONIAE AND P.AURIGINOSA.
POSISSESS ANTIFUNGAL ACTIVITY AGAINST N.CRASSA, A.EUMIGATUS,
A.BRASSICOLA, N. HEMATOCOCCA, F. CULMORUM AND F.OXYPORUM AND
AGAINST S.CEREVIASE AND C.ALBICANS YEAST. INACTIVE AGAINST
heterogeneities by mass spectrometry.";
Anal. Blochem. 274.69-80(1999).
-!- FUNCTION: PANGREASTATIN STRONGLY INHIBITS GLUCOSE INDUCED INSULIN
RELEASE FROM THE PANGREAS.
                                                         -1- FUNCTION: CHROMOSTATIN COMPLETELY INHIBITS CATECHOLAMINE RELEASE FROM CHROMAFFIN CELLS.
                                                                                                                                                                                                                                                                                                                                  MASS SPECTROMETRY: WW-8584.9; METHOD=MALDI; RANGE=19-94.
MISCELLANEOUS: BINDS CALCIUM WITH A LOW-AFFINITY.
SIMILARITY: BELONGS TO THE CHROMOGRANIN / SECRETOGRANIN PROTEIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Phosphorylation;

## ALIGNMENTS

NESULT I S42988
viral infectivity factor vif - human immunodeficiency virus type 1
C; Species: human immunodeficiency virus type 1, HIV-1
C;Date: 06-Feb-1995 #sequence_revision 06-Feb-1995 #text_change 20-Sep-1999
C; Accession: S42988
R; Wieland, U.; Hartmann, J.; Suhr, H.; Salzberger, B.; Eggers, H.J.; Kuehn, J.E.
submitted to the EMBL Data Library, March 1994
A; Description: In vivo genetic variability of the HIV-1 gene.
A; Reference number: S42940
A; Accession: S42988
A;Status: preliminary
A; Molecule type: DNA
A; Residues: 1-192 <wie></wie>
A; Cross-references: EMBL: Z30679; NID:q459595; PIDN: CAA83159.1; PID:q459596
C;Superfamily: AIDS vif protein

Gaps ö Length 192; Indels Score 44; DB 2; Pred. No. 4.6; 5; Mismatches Query Match 49.4%; Best Local Similarity 47.1%; 8; Conservative

Chromogranin A precursor [validated] - bovine
N; Alternate names: pituitary secretory protein I; secretory protein I
N; Contains: chromostatin; pancreastatin
C; Species: Bos primigenius taurus (cattle)
C; Date: 10-Sep-1999 #sequence_revision 10-Sep-1999 #text_change 18-Aug-2000
C; Accession: A41520, A28033; A24175; A60306; A61114; S15847; S39016; I46008; S38976
R; Tacangelo, A.L.; Grimes, M.; Eiden, L.E.
Mol. Endocrinol. 5, 1651-1660, 1991
A; Title: The bovine chromogranin A gene: structural basis for hormone regulation an A; Reference number: A41520; MUID: 92140395
A; Status: not compared with conceptual translation
A; Accession: A41520
A; Status: not compared with conceptual translation
A; Molecule type: DNA
A; Residues: 1-449 < AAC>
A; Cross-references: GB: S79270; NID: 9244423; PIDN: AAB21297.1; PID: 9244424
A; Residues: 1-449 < AAC>
A; Cross-references: GB: S79270; NID: 9244423; PIDN: AAB21297.1; PID: 9244424
A; Reference number: A28033; MUID: 97260925
A; Title: Primary structure of bovine pituitary secretory protein I (chromogranin A)
A; Reference number: A28033; MUID: 97260925
A; Molecule type: mRNA
A; Residues: 1-111, 'T', 113-190, 'Y', 192-253, 'P', 255-378, 'R', 380-449 < ANN>
A; Residues: 1-111, 'T', 113-190, 'Y', 192-253, 'P', 255-378, 'R', 1919163728

                                                                                                                                                                                                                                                                                 RESULT 11
S42980
viral infectivity factor vif - human immunodeficiency virus type 1
C;Species: human immunodeficiency virus type 1, HIV-1
C;Species: human immunodeficiency virus type 1, HIV-1
C;Date: 06-Feb-1995 #sequence_revision 06-Feb-1995 #text_change 20-Sep-1999
C;Accession: 842980
R;Wieland, U.; Hartmann, J.; Suhr, H.; Salzberger, B.; Eggers, H.J.; Kuehn, J.E. Submitted to the EMBL Data Library, March 1994
A;Bescription: In vivo genetic variability of the HIV-1 gene.
A;Reference number: $42940
A;Reference number: $42940
A;Accession: $42980
A;Accession: Draliminary
A;Molecule type: DNA
A;Residues: 1-192 <AHIED
A;Cross-references: EMBL:230641; NID:9459524; PIDN:CAA83118.1; PID:9459525
C;Superfamily: AIDS vif protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Viral infectivity factor vif - human immunodeficiency virus type 1

Viral infectivity factor vif - human immunodeficiency virus type 1

Viral infectivity factor vif - human immunodeficiency virus type 1

C; Species: human immunodeficiency virus type 1, HIV-1

C; Date: 06-Feb-1995 #sequence_revision 06-Feb-1995 #text_change 20-Sep-1999

C; Accession: S42945

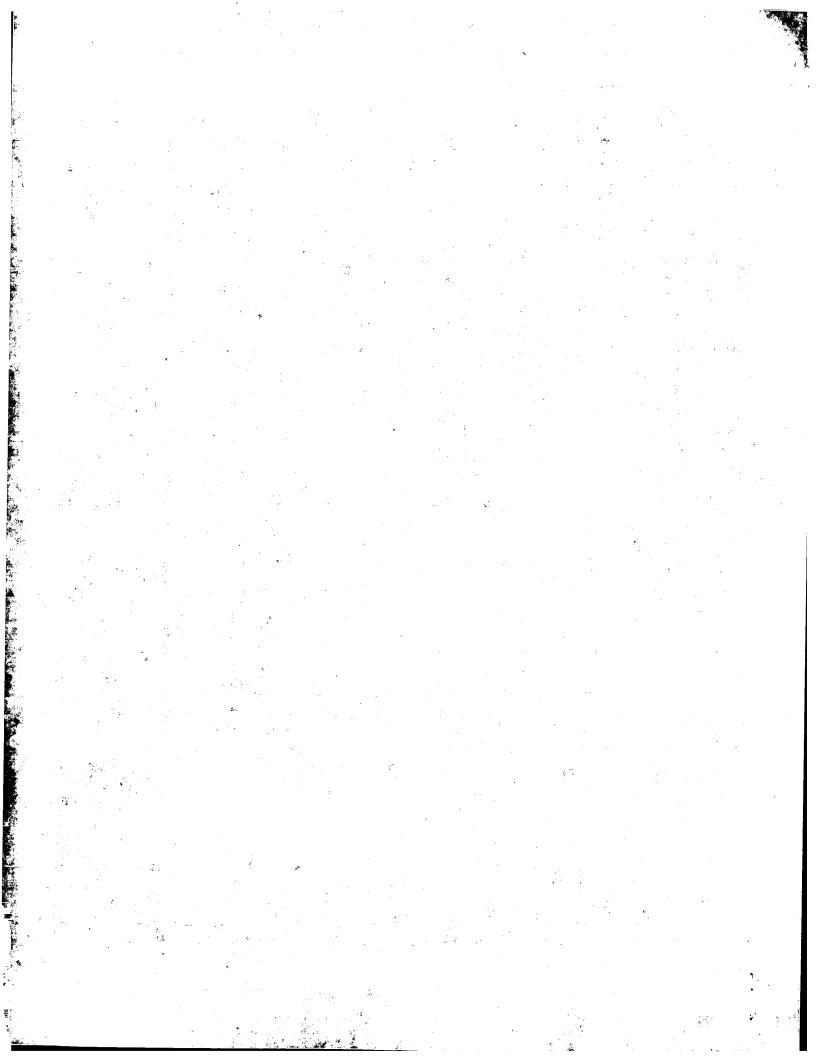

S; Wieland, U; Hartmann, J; Suhr, H; Salzberger, B; Eggers, H,J; Kuehn, J.E. submitted to the EMBL Data Library, March 1994

A; Description: In vivo genetic variability of the HIV-1 gene.

A; Reference number: S42940

viral infectivity factor vif - human immunodeficiency virus type 1
C;Species: human immunodeficiency virus type 1
C;Species: human immunodeficiency virus type 1, HIV-1
C;Date: 06-Feb-1995 #sequence_revision 06-Feb-1995 #text_change 20-Sep-1999
C;Accession: S43004
R;Wieland, U.; Hartmann, J.; Suhr, H.; Salzberger, B.; Eggers, H.J.; Kuehn, J.E.
submitted to the EMBL Data Library, March 1994
A;Description: In vivo genetic variability of the HIV-1 gene.
A;Reference number: S42940
A;Reference number: S43004
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-192 <WIE>
A;Residues: 1-192 <WIE>
A;Cross-references: EMBL:Z30695; NID:g459627; PIDN:CAAB3175.1; PID:g459628
C;Superfamily: AIDS vif protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  viral infectivity factor vif - human immunodeficiency virus type 1

                                                                                           This peptide represents a linear derivative of the protegrin family of peptide antibiotics. Protegrin antibiotics form part of the peptide antibiotic family which contain a beta-sheet secondary structure linked by disulphide bridges. The new derivatives are linear and lack the disulphide bridge. The novel derivatives are used to deliver active agents to an organism, e.g. therapeutic proteins, antibodies (or their fragments), nucleic acid, oligonucleotides, ribozymes, antitumour agents, and non-lytic but can cross mammalian cell membranes rapidly by a passive mechanism, so can deliver active agents to excland a deliver active agents to cytoplasm and nucleus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                      The present sequence is an antimicrobial protegrin peptide, which has a broad spectrum of activity against microbial targets, including gram-positive and gram-negative bacteria, yeast, fungi, protozoa and certain strains of viruses and retroviruses, e.g. HIV.

It can be used to preserve or disinfect a variety of materials, including medical equipment, foodsuffs, cosmetics, contact lens solutions, medicaments or other nutrient containing materials. It can also be used for the prophylaxis or treatment of microbial infections or diseases in plants and animals, e.g. conjunctivitis, keratitis, corneal ulcres, stomach ulcres associated with Helicobacter pylori, sexually transmitted diseases, gram-negative sepsis, endocarditis, pneumonia and other respiratory infections, urinary tract infections, systemic candidiasis and oral mucositis. It is biostatic or biocidal against clinically relevant pathogens exhibiting multi-drug resistance, e.g. vancomycin resistant correspondence or facealis, penicillin resistant staphylococcus cureus (MRSA). It is given at a dosage of 0.1 to 5, preferably 0.5 to 1 mg/kg/day, by injection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
New antimicrobial protegrin peptide(s) - having activity against bacteria, yeast, fungi, protozoa and certain strains of viruses (e.g. HIV)

It can be used to preserve or disinfect a variety of materials, including medical equipment, foodstuffs, cosmetics, contact lens solutions, medicaments or other nutrient containing materials. It can also be used for the prophylaxis or treatment of microbial infections or diseases in plants and animals, e.g. conjunctivitis, keratitis, corneal ulcers, stomach ulcers associated with Helicobacter pylori, sexually transmitted diseases, gram-negative sepsis, endocarditis, pneumonia and other respiratory infections, urinary tract infections, systemic candidiasis and oral mucositis.
                                                                                                                                                                                                                                                                                                                                                                                                              disinfection; prophylaxis; treatment; infection; disease; conjunctivitis; keratitis; corneal ulcer; stomach ulcer; STD; Helicobacter pylori; sexually transmitted disease; oral mucositis; pram-negative sepsis; endocarditis; pneumonia; biocidal; biostatic; respiratory infection; urinary tract infection; MRSA; protozoan; vancomycin resistant Enterococcus; pathogen; multi-drug resistance; penicillin resistant Staphylococcus neumoniae; pig; porcine; methicillin resistant Staphylococcus aureus; systemic candidiasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    exhibiting multi-drug resistance, e.g. vancomycin resistant Enterococcus faecium or faecalis, penicillin resistant Streptococcus penemoniae and methicillin resistant Staphylococcus aureus (MRSA). It is given at a dosage of 0.1 to 5, preferably 0.5 to 1 mg/kg/day, by injection.
                                                                                                                                                                                                                                                                                                               Antimicrobial protegrin; broad spectrum; gram-positive; bacterium; gram-negative; bacteria; yeast; fungus; fungi; protozoa; virus; retrovirus; HIV; human immunodeficiency virus; preservation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antimicrobial protegrin peptide(s) - having activity against bacteria, yeast, fungi, protozoa and certain strains of viruses (e.g. HIV)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Lehrer RI, Steinberg DA;

The present sequence is an antimicrobial protegrin peptide, which has a broad spectrum of activity against microbial targets, including gram-positive and gram-negative bacteria, yeast, fungl, protozoa and certain strains of viruses and retroviruses, e.g. HIV. it can be used to preserve or disinfect a variety of materials, including medical equipment, foodstuffs, cosmetics, contact lens solutions, medicaments or other nutrient containing materials. It can also be used for the prophylaxis or treatment of microbial infections or diseases in plants and animals, e.g. conjunctivitis, can also be used for the prophylaxis or treatment of microbial infections or diseases in plants and animals, e.g. conjunctivitis, keratitis, corneal ulcers, stomach ulcers associated with Helicobacter pylori, sexually transmitted diseases, gram-negative sepsis, endocarditis, pneumonia and other respiratory infections, urinary tract infections, systemic candidiasis and oral mucositis. It is biostatic or biocidal against clinically relevant pathogens exhibiting multi-drug resistance, e.g. vancomycin resistant Enterococcus faccium or faccalis, penicillin resistant Staphylococcus
                                                                                                                                                                                                                                                                                     Antimicrobial protegrin; broad spectrum; gram-positive; bacterium; gram-negative; bacteria; yeast; fungus; fungl; protozoa; virus; retrovirus; HIV; human immunodeficiency virus; preservation; disinfection; prophylaxis; treatment; infection; disease; conjunctivitis; keratitis; corneal ulcer; stomach ulcer; STD; Helicobacter pylori; sexually transmitted disease; oral mucositis; pram-negative sepsis; endocarditis; pneumonia; biocidal; biostatic; respiratory infection; urinary tract infection; MRSA; protozoan; vancomycun resistant Enterococcus; pathogen; multi-drug resistance; penicillin resistant Streptococcus pneumoniae; pig; porcine; methicillin resistant Staphylococcus aureus; systemic candidassis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antimicrobial protegrin peptide(s) - having activity against bacteria, yeast, fungi, protozoa and certain strains of viruses (e.g. HIV)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Steinberg DA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gu CL, Lehrer RI,
                                                                                                                                                                                                                                                      Antimicrobial protegrin peptide (9).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 23; Page 104; 130pp; English.

aureus (MRSA). It is given at a dosage of 0.1 to 5, preferably 0.5 to 1 mg/kg/day, by injection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is an antimicrobial protegrin peptide, which has a broad spectrum of activity against microbial targets, including gram-postive and gram-negative bacteria, yeast, fungi, protozoa and certain strains of viruses and retroviruses, e.g. HIV. It can be used to preserve or disinfect a variety of materials, including medical equipment, foodstuffs, cosmetics, contact lens solutions, medicaments or other nutrient containing materials. It can also be used for the prophylaxis or treatment of microbial infections or diseases in plants and animals, e.g. conjunctivitis,

keratitis, corneal ulcers, stomach ulcers associated with Helicobacter pylori, sexually transmitted diseases, gram-negative sepsis, endocarditis, pneumonia and other respiratory infections, urinary tract infections, systemic candidiasis and oral mucositis. It is biostatic or biocidal against clinically relevant pathogens exhibiting multi-drug resistance, e.g. vancomycin resistant Enterococcus faecium or faecalis, penicillin resistant Streptococcus faecium and methicillin resistant staphylococcus aureus (MRSA). It is given at a dosage of 0.1 to 5, preferably 0.5 to 1 mg/kg/day, by injection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Antimicrobial protegrin; broad spectrum; gram-positive; bacterium; gram-negative; bacteria; yeast; fungus; fungi; protozoa; virus; retrovirus; HIV; human immunodeficiency virus; preservation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to isolation of coding sequences and/or genes involved in tolerance to environmental stress in plants. The sequences (AA299305-298365) are useful for producing a transgenic plant having enhanced tolerance or resistance to environmental stress conditions such as anaerobic, flocoding, cold, dehydration, drought, heat stress or salinity. This is useful for producing improved yield, growth, development and productivity under environmental stress conditions, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolation of polynucleic acids useful for producing transgenic plant by isolating genes involved in tolerance to environmental stress
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
has a broad spectrum of activity against microbial targets, including gram-positive and gram-negative bacteria, yeast, fungi, protozoa and certain strains of viruses and retroviruses, e.g. HIV. It can be used to preserve or disinfect a variety of materials, including medical equipment, foodstuffs, cosmetics, contact lens solutions, medicaments or other nutrient containing materials. It can also be used for the prophylaxis or treatment of microbial infections or diseases in plants and animals, e.g. conjunctivitis, keratitis, conneal ulcers, stomach ulcers associated with Helicobacter pylori, sexually transmitted diseases, gram-negative sepsis, endocarditis, pneumonia and other respiratory infections,
                                                                                                                                                                                                            urinary tract infections, systemic candidiasis and oral mucositis. It is biostatic or biocidal against clinically relevant pathogens exhibiting multi-drug resistance, e.g. vancomyoin resistant Enterococcus faecium or faecalis, penicillin resistant Streptococcus pneumoniae and methicillin resistant Staphylococcus aureus (MRSA). It is given at a dosage of 0.1 to 5, preferably 0.5
                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

(I) and pulpapetides (II) encoded by them, are useful in pharmaceuticals, vaccines and diagnostic agents, particularly for treatment or prevention of human immune deficiency virus-I (HIV-I) infections, also for rational design of test or therapeutic reagents, or gene therapy vectors. Polypeptides, especially antibodies, specifically directed against (II) are similarly useful as pharmaceutical and diagnostic agents. (I) are specific for intersubtype C/B' of HIV-I so are useful in regions (particularly China and South-East Asia) where this subtype is prevalent. The products of the invention have antiviral activity. This sequence represents a protein encoded by the HIV-I subtype C genome described in the method of the invention.
also provides growth of crops in areas where they cannot grow without the induced osmotolerance. Sequences AAY77925-984 represent polypeptide sequences from A. thaliana that are encoded by the genes involved in environmental stress tolerance.

specification describes novel vif proteins (AAV01969-88) and genes encoding them (AAX35217-36). The vif gene is an accessory gene HIV-1 that has low functional mutagenicity and is conserved. In
                                                                                                                                                                                                                                                                                                                                                                                                   addition, attenuated, non functional vif clones are able to induce acids may be used to immunise memals. The attenuated, non-functional vif genes may be used in concert with other HIV-1 genes to produce vaccine that has a broad immune response against all viral components, and which minics many aspects of the immune responses induced by a live attenuated virus. Prophylactic vaccines which include viral acsape and contribute to lowering the viral set point during early infection stages.

                                                                                                                                                                                                                                                                        The present sequence represents the consensus sequence derived from attenuated, non-functional forms of the accessory protein vif (viral infectivity factor) of Human immunodeficiency virus type I (HIV-I).

The specification describes novel vif proteins (AAV01969-88) and the genes encoding them (AAX35217-36). The vif gene is an accessory gene for HIV-I that has low functional mutagenicity and is conserved. In addition, attenuated, non functional vif clones are able to induce immune responses capable of destroying native pathogen. Vif nucleic acids may be used to immunize mammals. The attenuated, non-functional vif genes may be used in concert with other HIV-I genes to produce vaccine that has a broad immune response against all viral components, and which mimics many aspects of the immune responses induced by a live attenuated virus. Prophylactic vaccines which include vif could limit both viral escape and contribute to lowering the viral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
